

Bone Health is Important!

Most of us take our bones for granted. With the exception of our teeth, bones are invisible. They do the important work of supporting us and maintaining our health behind the scenes. Unless we have an x-ray scan that shows that our bones are deteriorating, we're unlikely to find out that we have problems in our bone health unless we actually break one — and then, it's too late to take steps to prevent the problem.

At Women's Health Associates, we're dedicated to assisting those concerned about their bone health — and one way we help is by offering information that allows you to determine your bone health. We'll help you assess your fracture risk, examine your diet, and develop an understanding of why bone health matters so much to your overall health and well-being.
